10 underperforming queries

Master of Software Engineering

Introduction to Data Management

These two queries performed poorly. We were getting results that had the following words in the text but they were scattered throughout. Once position was taken into account for each token in its respective document, we were able to get results that had these words near each other. This allowed us to get results that matched what we were more looking for than before without position.

Ramesh Jain Blog

Sandy Irani UCI

After including positions we were getting pages that had these Professors' names in tact, but we weren't getting their main website pages. In order to get the more relevant pages pertaining to these Professors we gave more weights to titles and accounted for these extra weights in our scoring, so that when query words are in the title they would rank higher and are more likely to show up.

Reading

Researching

We experimented with queries like these in the beginning because we wanted to test if our stemmer was working successfully. Previously we implemented stemming from scratch so we would have control over what the words transform into, but after these results we realized our implementation of stemming isn't feasible. We researched and decided to use the built in stemming library.

Past Teaching

Papers

We realized a lot of the Professor's websites had subheadings that were along the lines of past teachings and papers, but when we queried these we weren't getting the sites we wanted because they weren't the main headings. So we also decided to give more weightage to subheading tags such as <h2>, <h3>, and so on.

Computer Science

Donald Bren School of Computer Science

In the beginning we saw that queries using even common words such as computer and science which showed up a lot of times in our index took a long time to find. In order to speed up, at least the queries with the tokens that were commonly found in our index, we ordered it by frequency so that the most sought after term would be in the beginning parts.
